Approved for public release; distribution is unlimited.

Prepared for U.S. Army Corps of Engineers
Washington, DC 20314-1000

Abstract

The National Wetland Plant List (NWPL) represents a collaborative effort between four Federal agencies, under the administrative responsibilities of the U.S. Army Corps of Engineers, to update and administer the national list. In a several-year effort, the NWPL was updated for nomenclature, taxonomy, and wetland ratings for 7828 species across the United States and territories. The wetland ratings represent the frequency of occurrence of a plant species in a wetland and are used in direct support of the Section 404 of the Clean Water Act, the Swampbuster provisions under the Farm Bill, and the National Wetland Inventory Program. The NWPL is used mostly in conjunction with wetland delineation protocols. It is also used to support wetland restoration and mitigation efforts and as an indicator to measure various environmental conditions. Updating the NWPL was a national effort involving Federal, state, academic, and public sectors.

Preface

This research was funded by the US Army Corps of Engineers, Wetland Regulatory Assistance Program (WRAP).

The principal investigator was Robert W. Lichvar of the Remote Sensing/Geographic Information Systems (RS/GIS) and Water Resources Branch, Cold Regions Research and Engineering Laboratory (CRREL), U.S. Army Engineer Research and Development Center (ERDC), Hanover, NH. This study was conducted under the general supervision of Timothy Pangburn, Chief, RS/GIS and Water Resources Branch; Dr. Justin B. Ber- man, Chief, Research and Engineering Division; Dr. Lance Hansen, Deputy Director; and Dr. Robert E. Davis, Director. COL Kevin J. Wilson was the Commander and Executive Director of ERDC, and Dr. Jeffery P. Hol- land was the Director. Permission to publish was granted by the Director, Cold Regions Research and Engineering Laboratory.

The update of the National Wetland Plant List reflects the efforts of many people from across the country, a list way too long to include here. The au- thor thanks the other members of the National Panel, who worked as a sol- id team to get this list through a lengthy process; they are Mary Butterwick, U.S. Environmental Protection Agency; Bill Kirchner, U.S. Fish and Wildlife Service (FWS); and Norm Melvin, Natural Resources Conservation Service. The author recognizes the great efforts put forth by the Regional Panel members and their alternates, who did the bulk of the heavy lifting. Behind the scenes were the critical workers, including John Kartesz and Misako Nishirno and their amazing database; John Guineau, web programmer; Jennifer Gillrich, who kept it all straight near the end; and Lindsey Lefebvre, who was just there and did the endless lists of items. The author also thanks Meg Gaffney-Smith, Karen Mulligan, Mark Sudol, and Kathy Trott, from U.S. Army Corps of Engineers headquarters, who believed in this effort and never doubted that this project was going in the right direction. Also, the author thanks the other collaborating agen- cies for supplying people and knowledge. Bill Wilen (FWS) was the key person who had the vision for this project and who helped make a lot of the critical links behind the scenes in Washington that brought many key elements together. Finally, the original efforts and energy put forth by Por- ter (Buck) Reed made it possible to build upon a sound legacy.

1 Background

The U.S. Army Corps of Engineers (Corps) assumed administrative responsibilities for the National Wetland Plant List (NWPL) in 2006. In 2008 the Corps began to update the NWPL as a cooperative effort with the U.S. Fish and Wildlife Service (FWS), the U.S. Environmental Protection Agency (EPA), and the Natural Resources Conservation Service (NRCS). The 2012 updating process incorporated all appropriate information and wetland plant ratings from FWS's 1988 (Reed 1988) and draft 1996 (List 96) wetland plant lists. This update of the NWPL integrates the current state of the science with an expanded effort by many professionals nationally to improve the wetland ratings.

For over two decades, the predecessor of the NWPL, the National List of Plant Species that Occur in Wetlands (Reed 1988), hereafter called List 88, has served as the standard reference for plant species' wetland indicator status ratings in the United States. These ratings are used for many purposes, including wetland delineation, assessment, mitigation, and habitat restoration. List 88 was developed by the FWS in cooperation with the Corps, EPA, and NRCS (known as the Soil Conservation Service at the time) (Lichvar and Minkin 2008). Wetland indicator status ratings were assigned to plant species that occur in wetlands in 13 FWS regions. The five rating categories assigned to List 88 (Table 1) were developed based on a thorough review of the botanical literature and the best professional judgment of national and regional experts. Each plant species was assigned a rating that represented the estimated probability, or frequency, with which it was thought to occur in wetlands, as opposed to non-wetlands, across its entire range.

Table 1. Former FWS wetland plant indicator status categories.

Wetland Indicator Status	Definition	Estimated Probability
Obligate Wetland	Occur almost always under natural conditions in wetlands	>99%
Facultative Wetland	Usually occur in wetlands, but occasionally found in non-wetlands	67–99%
Facultative	Equally likely to occur in wetlands or non-wetlands	34–66%
Facultative Upland	Usually occur in non-wetlands, but occasionally found in wetlands	67–99%
Obligate Upland	Occur in wetlands in another region, but occur almost always under natural conditions in non-wetlands in the region specified	>99%

2 Updating the NWPL

The updating of the NWPL began in 2008 with a meeting of the National Panel (NP), which consisted of a botanist from each of the four agencies. At that meeting, the NP designed a strategy for accomplishing the update. The NP decisions were published as part of the administrative record for the update (Lichvar and Minkin 2008).

As for previous versions, the NWPL has been updated to support wetland delineation efforts under Sec. 404 of the Clean Water Act and the Swampbuster provisions under the Farm Bill and for use in the National Wetland Inventory Program. To do so, the Corps aligned the NWPL with the interagency wetland delineation manual updating effort and the regional supplements. The NWPL is now geographically divided using the 10 regional Corps wetland delineation boundaries across the U.S. and its territories (Wakeley 2002) (Fig. 1). To bring the nomenclature and taxonomy up to date, the NP collaborated with Dr. John Kartesz of the Biota of North America (BONAP) (<http://www.bonap.org>). Maintaining current nomenclature is critical to having a scientifically current list. Once the wetland plants were updated for nomenclature and were realigned geographically to the new regions, the NP began the evaluation of indicator status ratings using List 96 as the starting point. List 88 had 6728 species while List 96 had 7662 species. The 2012 NWPL has 7828 species. The majority of these changes in species numbers are the result of new taxonomic and nomenclatural interpretations published since the development of the original List 88.

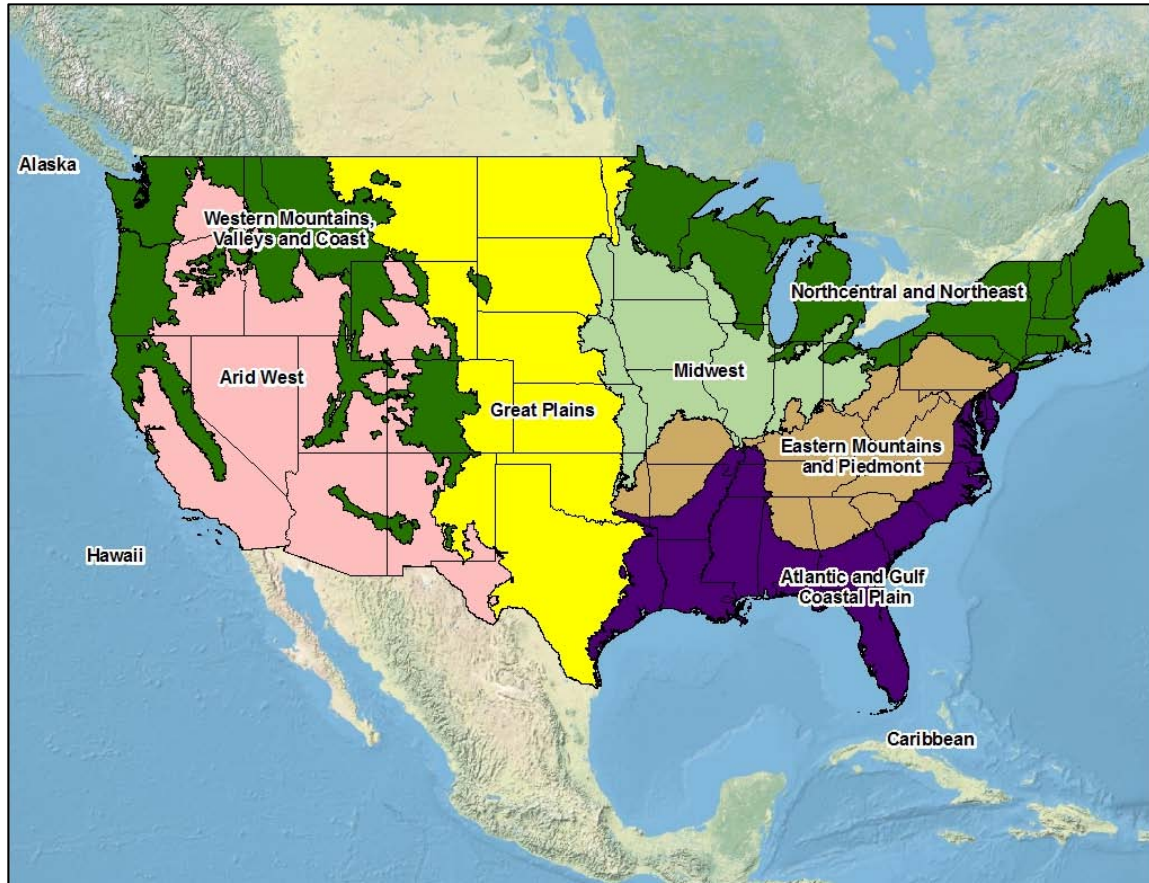

Figure 1. U.S. Army Corps of Engineers wetland delineation regions of the U.S.

For this update, the NP developed the technical changes to the wetland rating system previously used by the FWS. The definitions of the wetland plant rating groups were refined three times. The first was by the National Panel (NP) in 2008 (Lichvar and Minkin), the second by the NP and the National Technical Committee for Wetland Vegetation (NTCWV) (Lichvar and Gillrich 2011), and finally by the NP (Table 2) (Lichvar et al. 2012). The current definitions do not use numerical categories with frequency units because no data exist to support that method of assigning ratings; instead, the new definitions use field-based ecological terminology. The numerical wetland categories were not eliminated but were reassigned for use in any “challenges or requests” as part of a process to change specific species wetland ratings using a specific sampling method developed by the NP and the NTCWV.

Table 2. Short version of the NWPL wetland indicator status groups. More complete definitions, including examples of wetland plants and descriptions of wetland features, were published by Lichvar et al. (2012).

Wetland Indicator Status	Definition
Obligate Wetland (OBL)	Almost always occur in wetlands
Facultative Wetland (FACW)	Usually occur in wetlands, but may occur in non-wetlands
Facultative (FAC)	Occur in wetlands or non-wetlands
Facultative Upland (FACU)	Usually occur in non-wetlands, but may occur in wetlands
Obligate Upland (UPL)	Almost never occur in wetlands

The NWPL also differs from the former FWS lists in other ways:

- The 2012 NWPL rates wetland plants at only the species level. The NP recognized that there are over 1200 infraspecific species associated with the 8154 species. The knowledge required to assign wetland ratings to 2400 infraspecific taxa isn't available in most cases; most of the infraspecific taxa had not been rated in previous lists and would require extensive and in-depth investigation into these taxa's habitat preferences. Additionally, the professional wetland community generally doesn't work at this lower level of plant classification.
- This update dropped the +/- rating symbols applied to many former FWS wetland species ratings. This action reflects the lack of data to support those ratings.
- The NWPL no longer uses the symbols NA (no agreement), NO (no occurrence), and NI (no indicator) because this update either used additional professional input to resolve species ratings or verified the geographic occurrence, which eliminated the need for those categories.

Following previous protocols used by the FWS for developing wetland plant lists, the NP established Regional Panels (RPs) as the core working groups for updating the NWPL. For each of the 10 Corps wetland delineation regions, the NP selected as an RP primary member one botanist or ecologist from each of the four collaborating agencies, with many members having an alternate. The NP established requirements for being an RP member and filled positions after reviewing resumes from agency applicants. They also developed a website that provided all previous digital information obtained from the FWS (http://wetland_plants.usace.army.mil/). This website hosted literature gathered by the FWS to support their lists, as well as any previous input (votes) made by

former RP members or others who were part of the administrative record. The NWPL web site also provided distribution maps, links to other botanical web sites, descriptions of biological attributes, and photographs of most species. The site was designed so that members could independently work at their own pace to evaluate and rate each species online. The website offered the 65 RP members and their alternates a secure method of logging in and voting. Each species page provided a specific voting capability where RP members could assign a wetland rating and make technical comments. The RP members relied on their professional knowledge about species in their regions, literature, input from others, and coordination within their RP to assign the wetland ratings.

Evaluation of the 9751 wetland plant species began in 2008. The national effort involved a series of 12 rounds of input by various groups, including the public. The RPs rated the majority of species in the first two rounds of voting. The next three rounds resolved any ties, former FAC species, and species lacking any input. Thirty external professional botanists, along with Robert Mohlenbrock, John Kartesz, Mary Butterwick, and Robert Lichvar, evaluated these three rounds. In Round 6, the list was published in the *Federal Register* for 60 days to allow for public input. Based on public input on 5315 species, 2791 species for which there was disagreement with the RP draft ratings were returned to the RP for further evaluation. In Round 7, the RPs assigned ratings based on the public input, and in Round 8, the NP addressed any unresolved species remaining from Round 7 that were a result of ties within the RP. In Rounds 9–12, the NP dealt with any remaining unresolved species that were a result of disagreements between the RPs and public input. The NP also evaluated species for which there had been a shift from FAC to FACU, from FACU to FAC, or by two or more categories of wetland ratings. In Round 10, the NP identified 87 species of wetland plants that they felt needed further evaluation and returned them to the RPs. Rebuttals from the RPs were resolved by the NP in Round 11, and wetland ratings were assigned for unresolved Caribbean species in Round 12.

During the update process, the NWPL received 130,000 votes or other pieces of input. This input represents comments, data, or votes made online or in writing by 472 individuals. These 472 individuals include 65 RP members and their alternates, 30 contracted professional botanists and academicians, and 377 public and professional biologists. During the *Federal Register* comment period, the public made 16,397 votes online for 5315 species across all regions; wrote 1159 technical comments online; and submitted 35 written letters, of which many included supportive data for numerous species.

To assign the final wetland ratings, the NP developed a set of computer algorithms that applied rules to the input. The basic rule was that if the RP and all public input were in agreement, then consensus ruled and the species received that wetland rating. Then, as consensus dissolved, the NP began weighting the input, first from the 30 academic and professional botanists, then from other recognized experts, and finally from the various rounds of input to determine the result that was closest to consensus. The NP then developed these rules into 18 algorithms, which are shown for each species on the NWPL website by listing the algorithm number. The algorithms, which are presented and explained with a downloadable file available at the website (http://wetland_plants.usace.army.mil/), assessed the entire database of input.

3 Final 2012 NWPL

Appendix A provides the national list of the 2012 wetland ratings for the 7731 species, arranged alphabetically by species with their authorities and common names. Their wetland ratings are shown in columns by the ten Corps wetland regions, which are given using the acronyms provided in Table 3.

Table 3. U.S. Army Corps of Engineers regions.

Region	Abbreviation
Atlantic and Gulf Coastal Plain	AGCP
Alaska	AK
Arid West	AW
Caribbean Islands	CB
Eastern Mountains and Piedmont	EMP
Great Plains	GP
Hawaii and Pacific Islands	HI
Midwest	MW
Northcentral and Northeast	NCNE
Western Mountains, Valleys and Coast	WMVC

Within several of these regions are newly designated subregions where 204 species have subregional ratings (Appendix B). The South Pacific Islands (SPI), including Guam and Samoa, are a subregion under Hawaii. There are 180 distinct wetland species for the SPI. Many of these also occur in Hawaii, but the ratings in the subregion list are specific for use in that subregion. Two subregions were developed within the contiguous 48 states: one in the Atlantic and Gulf Coastal Plain (AGCP) region and the other in the Northcentral and Northeast (NCNE) region. The subregion in the AGCP, the Western Gulf Coast, has 13 species with wetland ratings that differ from those in the rest of the AGCP. The subregion in the NCNE, the North Central Great Lakes, has 2 species with wetland ratings that differ from those in the rest of the NCNE region. In Alaska, 15 subregions were established, with 9 plant species and 34 wetland ratings. These ratings differ from those in the rest of the AK region. Maps and ratings for the subregions are shown in Appendices B–D and on the website.

This national list does not include any synonyms; it only shows the currently accepted names. There are close to 30,000 synonyms associated with these current names, which is too long a list to publish and is not practical for field use. To find older names from dated floras and other references, use the NWPL website (http://wetland_plants.usace.army.mil/), where you can enter a scientific name into the search box, and hit "Search." The synonym will appear in a column on the right side of the screen; clicking on the name you have searched for will take you to the current name and species information page. Also, lists of synonyms for various plant lists are provided on the web page under "Display List" and "Other Lists," where you can select "See All Synonyms." The synonyms are displayed in alphabetical order in one column, and they correspond to the current scientific name in an adjoining column.

13. SUPPLEMENTARY NOTES					
14. ABSTRACT The National Wetland Plant List (NWPL) represents a collaborative effort between four Federal agencies, under the administrative responsibilities of the U.S. Army Corps of Engineers, to update and administer the national list. In a several-year effort, the NWPL was updated for nomenclature, taxonomy, and wetland ratings for 8,154 species across the United States and territories. The wetland ratings represent the frequency of occurrence of a plant species in a wetland and are used in direct support of the Section 404 of the Clean Water Act, the Swampbuster provisions under the Farm Bill, and the National Wetland Inventory Program. The NWPL is used mostly in conjunction with wetland delineation protocols. It is also used to support wetland restoration and mitigation efforts and as an indicator to measure various environmental conditions. Updating the NWPL was a national effort involving Federal, state, academic, and public sectors.
